

HFT Survey/Alignment work update

S. Margetis

- **Overall Survey status and plans for all three systems**
 - some of the issues encountered and discussed
- **Alignment work progress**
 - with Ideal and Survey geometry as input
 - with dirty and cleaner data
 - masking, beam constraint, space charge
 - Plans for all three
- **Using the pxl ladder overlap**
 - checking/monitoring

Overall Survey Status

- PXL

- Run-13 prototype exercise very useful
- All 3 sectors measured, 3 times, methods/structures established, data extracted and put in "geometry"-form in Db
- Chip surface variations mapped and in Db
- Extensive studies of repeatability, time-dependencies
- Methods etc ported to other systems

- PXL

- All 3 sectors measured, 3 times, methods/structures established, data extracted and put in "geometry"-form in Db

Overall Survey Plan

Steps:

1. Sector survey
 2. Kinematic mounts survey
 3. PST survey
 4. Mock PST survey
 5. PXL half survey
- } not done

- PXL

- All 3 sectors measured, 3 times, methods/structures established, data extracted and put in "geometry"-form in Db

Sector Survey Results

- all 3 sector has been surveyed ≥ 3 times

Sector Survey

- 3 tooling balls on each sector are used to define sector coordinate

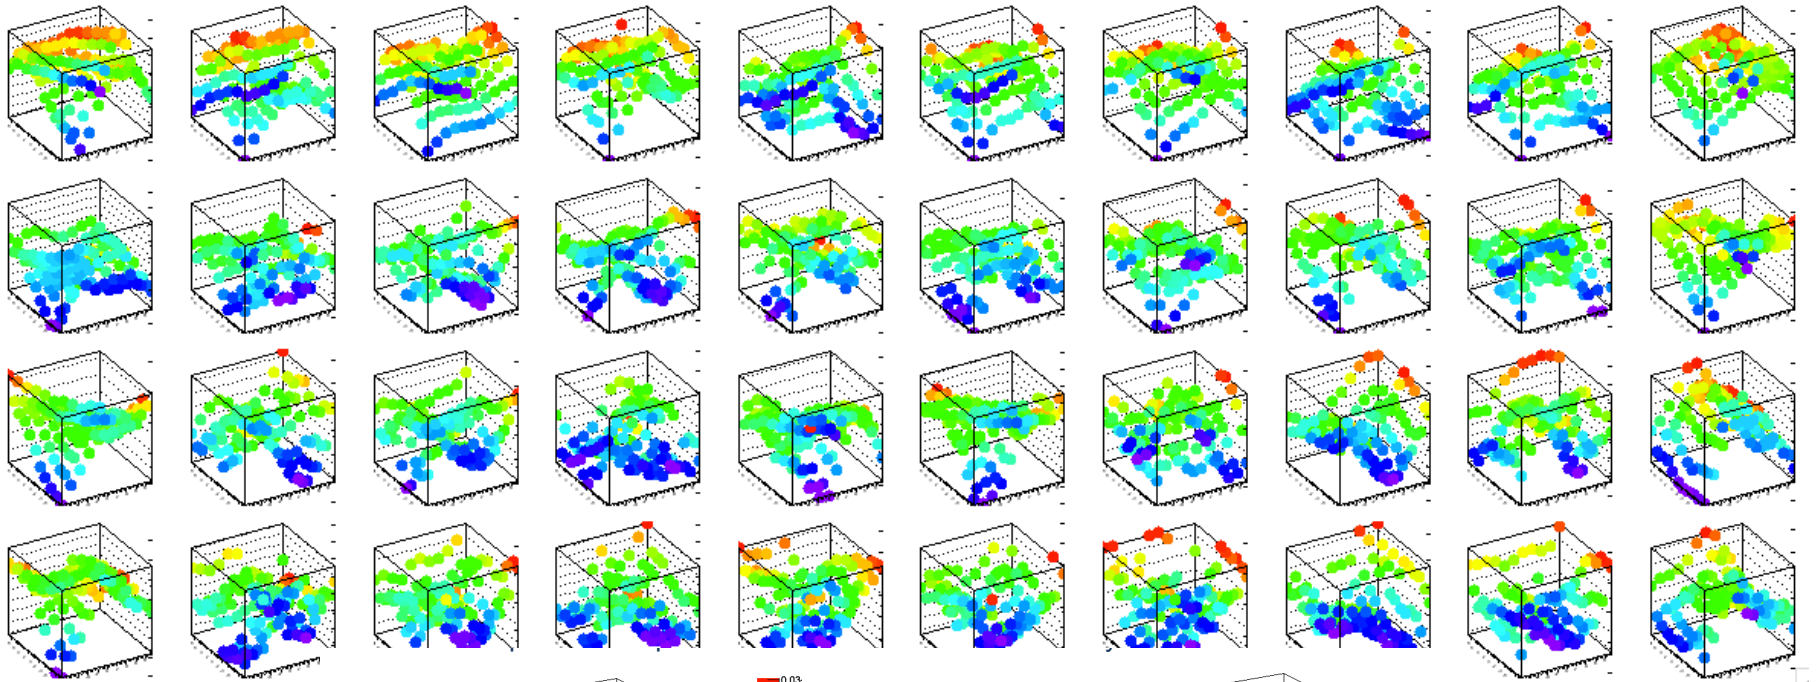

- 2 features on each chip/wafer are used to define chip local coordinate
- Each chip is scanned with 121 points to get the surface profile

- PXL

- Chip surface variations mapped and in Db

Sector Survey Results

- PXL

- Extensive studies of repeatability, time-dependencies

The Ladder Extension

The Ladder Contraction

No Apparent Change with Dehydrant

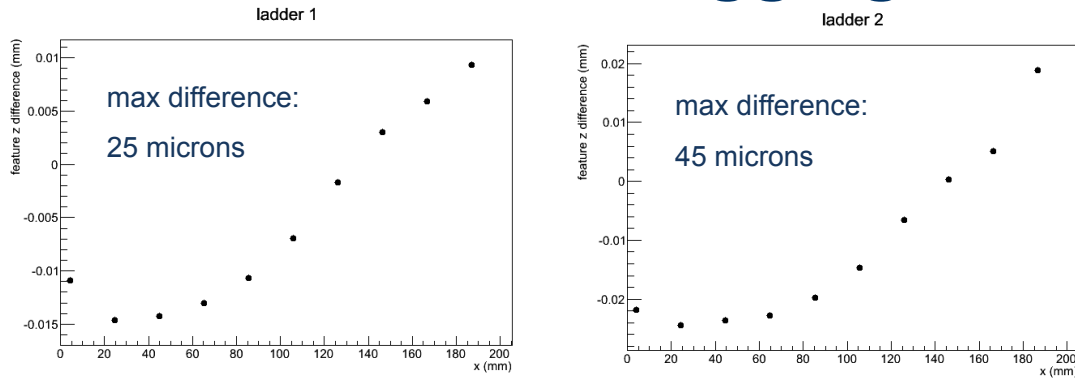

Feature Distance within a Sensor

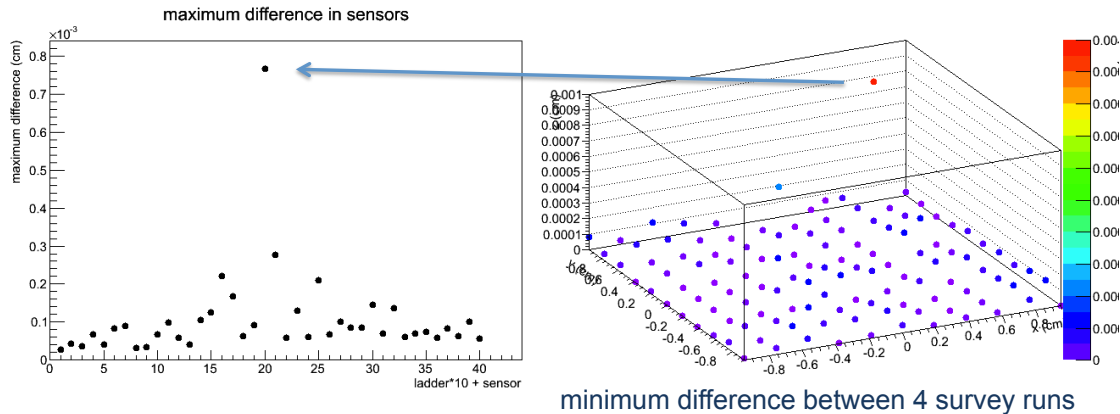

- PXL

- Extensive studies of repeatability, time-dependencies
 - This year's sector construction done with reduced standards

The Ladder “Sagging”

Repeatability within Sensors

- IST

- Survey done at two places: Fermilab and BNL
- All ladder survey completed - also the mounting positions on ISC
- Data organized according to system conventions and structures
- Some initial tests with geometry -> O.K.

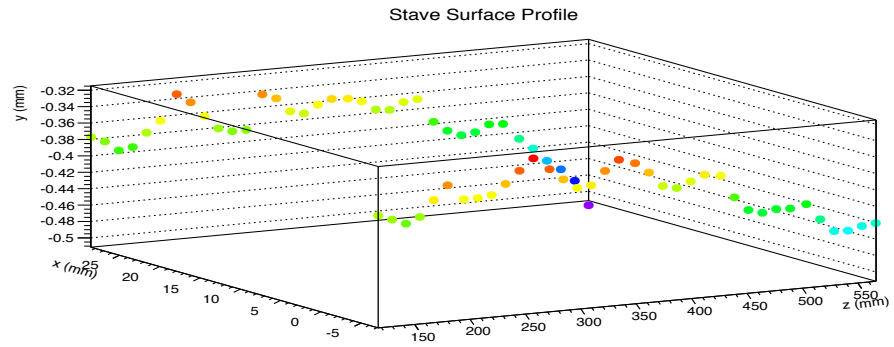

- **IST**

- All ladders survey completed - also the mounting positions on ISC

UIC/FNAL survey

MIT/BNL survey

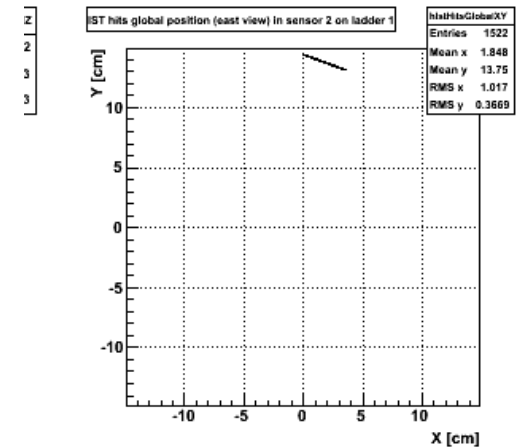

*IST-33.

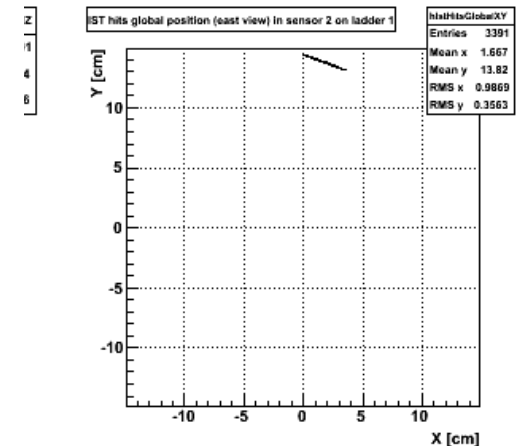

- IST

- Data organized according to system conventions and structures
- Some initial tests with geometry -> O.K.

irrent GEANT geometry)

StIstDbMaker with Db

Db tables for StIstDbMaker

- GlobalXYZ = TpcOnGlobal*IdsOnTpc*PstOnIds*IstOnPst*istLadderOnIst*istSensorOnLadder

TGeoHMatrix parameters for ladder/sensor geometry (current IST GEANT geometry dev14, based on SolidWorks drawings rev. August 2012):

1st ladder Db table

-0.9405848	-0.3395589	0.0	1.77085
0.3395589	-0.9405848	0.0	13.77975
0.0	0.0	1	0.0

1st sensor on Ladder

1	0	0	0
0	1	0	0
0	0	1	-19.3250

- SSD

- Survey done at same machine at LBL as PXL
- All ladders completed
- Pending data organization

Target on end of wafer (backside)

Targets on edges of wafer (front)

Ladder's sagitta ~ 300 microns

Reference point

Jim Thomas - LBL

Alignment Status

- **Alignment work progress**
 - **Methods ported from SVT/SSD era with modifications**
 - with Ideal and Survey geometry as input
 - with dirty and cleaner data
 - masking, beam constraint, space charge
 - Plans for all three
- **Using the pxl ladder overlap**
 - checking/monitoring

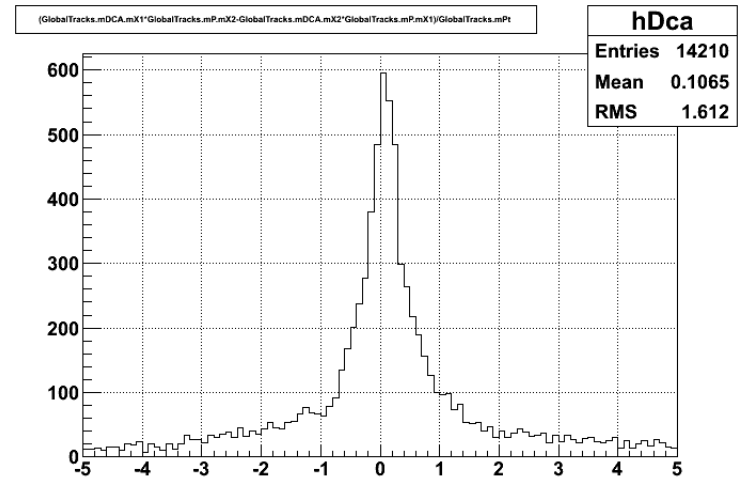

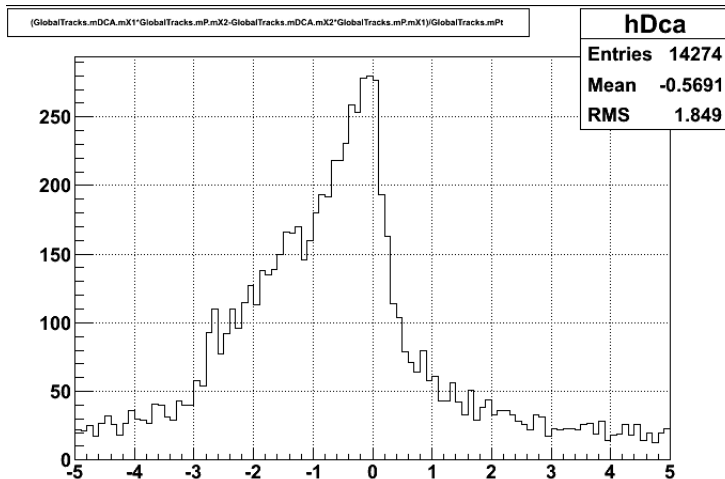

space charge

- Standard DB:

fullFieldB	satRate	factor	detector	offset	ewratio
2.649e-14	1000000000.000000000	2.00000000	0.00000000	0.00000000	1.00000000
5.665e-10	1000000000.000000000	1.00000000	0.00000000	-2739000.00000000	1.00000000

- SpaceCharge = $\sum \text{fullFieldB} * (\text{scalerRate} - \text{offset})^{\text{factor}}$
- non 0 offset means some correction even with no beam, not good for low luminosity data
- Local DB: offset set to 0

primary vertices with new space charge

beam line

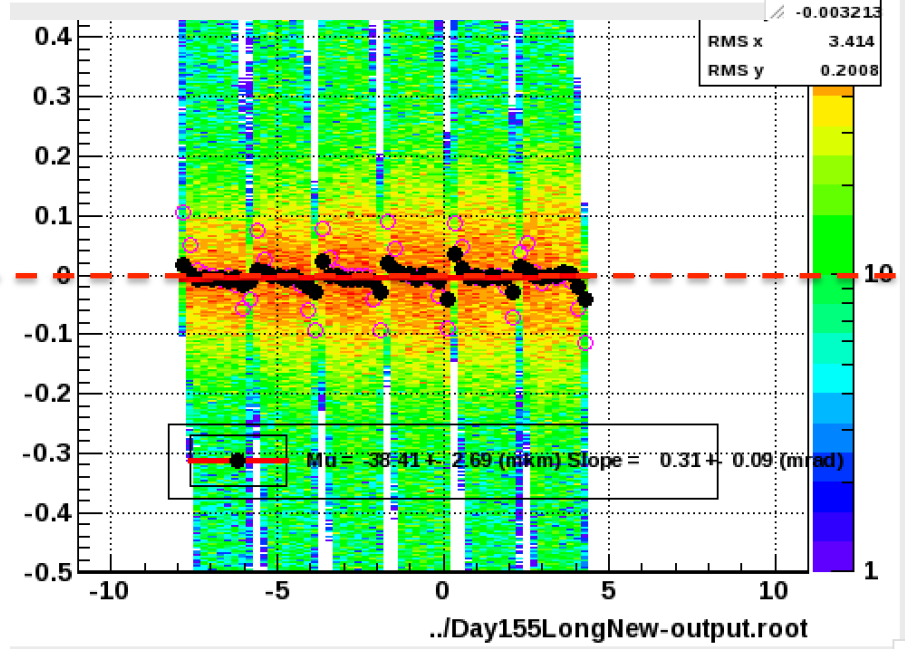

- Calibrated fill by fill
- new space charge and beam line set up is used for production of day 150

Un-Calibrated/Ideal

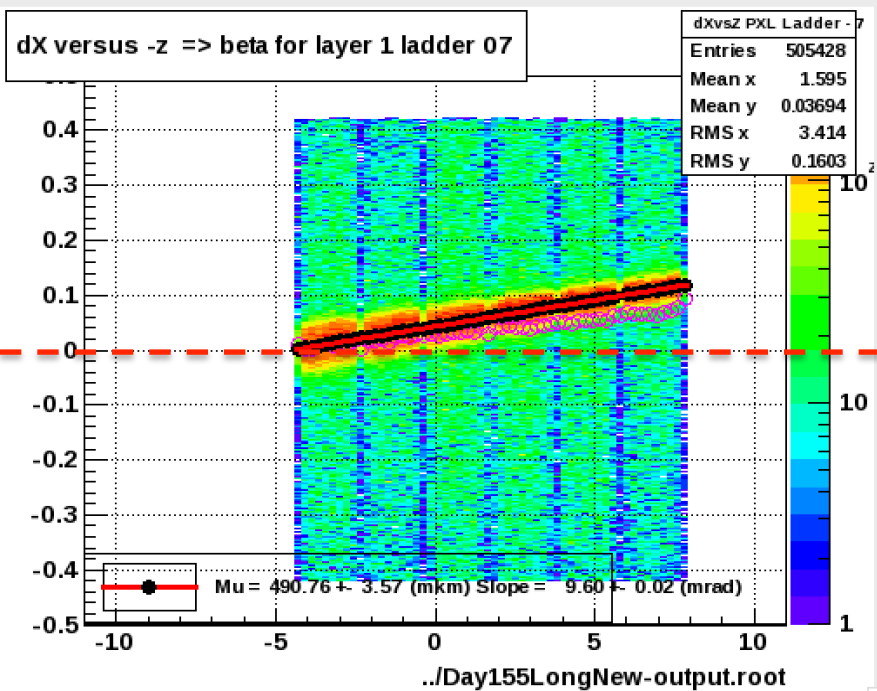

Calibrated/Survey

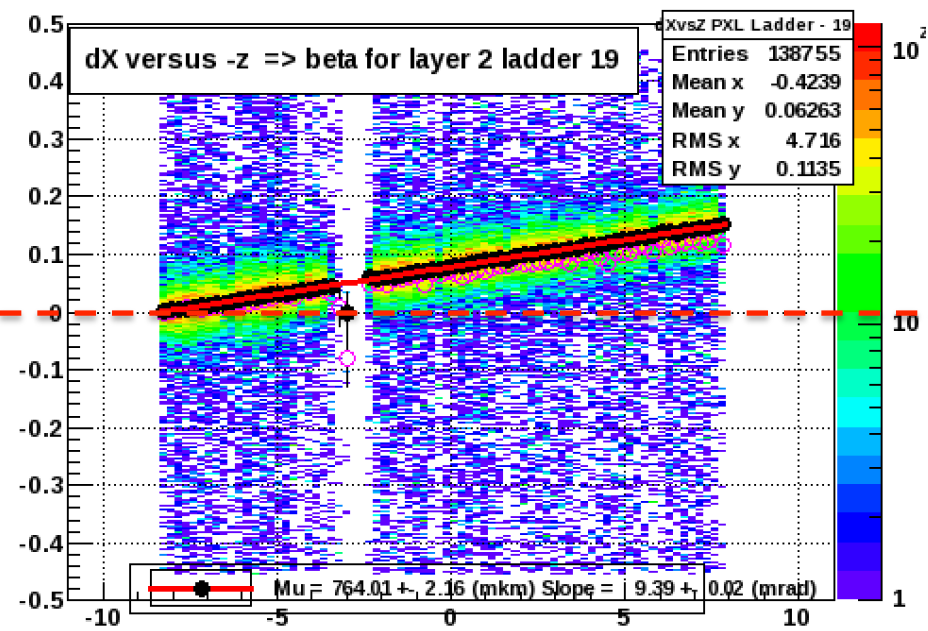

Q: Is it a Sector thing or individual Ladder ?

A: Rotations are common

Q: Is there stability over two different runs?

A: YES: Rotations are very stable, shifts <100um within calibration errors

Day 152 – First Pass Alignment Update

- With the ~600K events I got from Long, I ran the alignment code and got precise estimates (see slide-2)
- Produced the “corrected” geometry and re-run the full BFC with updated geometry
 - about 50K event so far

FIRST PASS ESTIMATED Corrections (angles [only] need a minus sign)

SECTOR 4

dX mkm	dY mkm	dZ mkm	alpha mrad	beta mrad	gamma mrad	Comment
-100	300	2900	0	0.	-0	Average for PXL sector 4 Ladder 1
-20	150	2970	0	0.	0	Average for PXL sector 4 Ladder 2
-100	350	2700	0	0.	-0	Average for PXL sector 4 Ladder 3
-200	+400	3000	0	0	0	Average for PXL Ladder 4

SECTOR 7

1500	2100	3000	-10	10	80	Ladder 1
2350	1150	2900	-15	10	80	Average for PXL sector 7 Ladder 2
2330	1800	2440	-15	20	80	Average for PXL Ladder 3
2230	2710	2570	-10.	20	80	Average for PXL Ladder 4

!!!

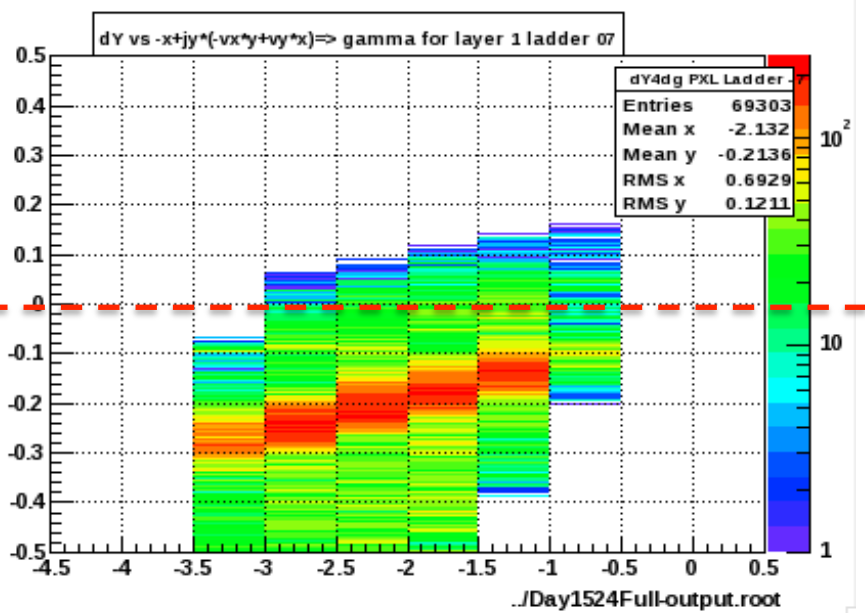

Sector 7 ladder 1 (inner) GLOBAL after BFC rerun (50K)

Sector 7 ladder 1 (inner) GLOBAL after BFC rerun

Sector 7 ladder 1 (inner) GLOBAL after BFC rerun

To Do list

- Simulation:
 - Individual ladder rots/transls
 - rots in progress
 - Thorough tests is a must
- Code/methods synchronization
- Multi-pass chain implementation/establishment
- Align, monitor time-dependences, understand

Clean/Calibrated Data a MUST for proper Alignment

- Using the pxl ladder overlap
 - checking/monitoring

Projection Points 2D-distribution
(overlapping region in Global)

Real read-out hits 2D-distribution
(overlapping region in Global)

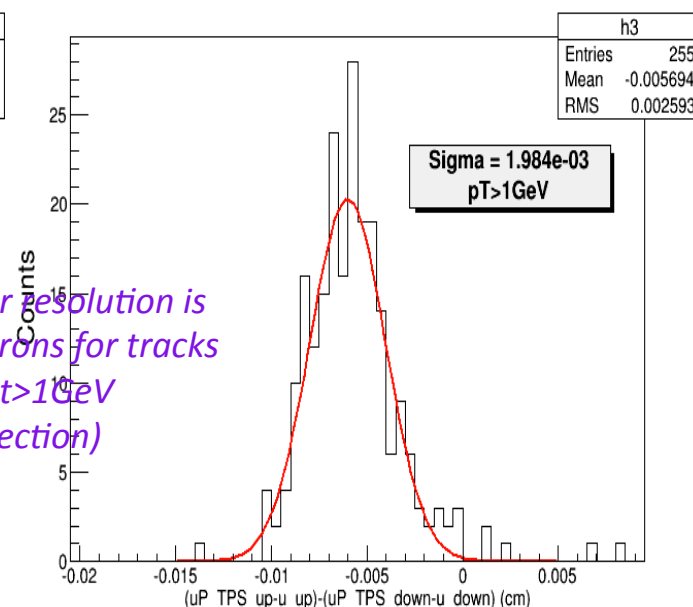

- Using the pxl ladder overlap
 - checking/monitoring

Single Sensor resolution
is about 19.66 microns
(u direction)

Single Sensor resolution is
about 14 microns for tracks
with $p_T > 1\text{ GeV}$
(u direction)

- Using the pxl ladder overlap
 - checking/monitoring

TPS Correction Applied

Example : Relative Misalignments
can be seen **between Sector 4
Ladder 3 and Ladder 4**
