

AGML geometry for PIXL

- Use Flemming's numbers (translation of SolideWorks Geometry \leftrightarrow TGeo) to implement the geometry in AGML
 1. a single sector : 4 active pixels ladders + mount structure
 2. Duplicate the single sector (x10) and place it into the IDSM
 3. Check for overlaps
 4. Materials
- Next steps

A single pixl sector

Colors are only to distinguish GEANT shapes :

- brown : BOX
- Purple : TUBS
- green : BOX for the top of the sector
- Dark green (top and bottom) : BOX for silicon active wafer

12/16/11

PIXL in AGML

3

Full pixl geometry : 10 sectors

Pixl in IDSM

...still flying in the middle of the IDSM ...

Material and Overlaps check

- All the structures here (arcs, planes) are made of carbon
- Only the active silicon pixel ladders is made of “silicon”

```
<!-- silicon -->
<Volume name="PXSA" comment="silicon right part of top sector" >
<Material name="Sensitive" isvol="1"/>
<Attribute for="PXSA" seen="1" colo="5" />
<Material name="Silicon" />
<Shape type="BOX" dz="HalfPixZ" dx="HalfPixR" dy="HalfPixThk" />
  <Instrument block="PXSA" >
    <Hit meas="z" opts="S" bins=".00001" />
    <Hit meas="y" bins=".00001" />
    <Hit meas="x" bins=".00001" />
    <Hit meas="ptot" nbits="16" min="0" max="100" />
    <Hit meas="cx" nbits="10" />
    <Hit meas="cy" nbits="10" />
    <Hit meas="cz" nbits="10" />
    <Hit meas="sleng" nbits="16" min="0" max="500" />
    <Hit meas="tof" nbits="16" />
    <Hit meas="step" bins=".01" />
    <Hit meas="eloss" nbits="16" />
  </Instrument>
```

- TGeo has a package to detect overlaps/intrusion between volumes
- No overlaps has been found :
- The report is here : http://drupal.star.bnl.gov/STAR/system/files/TGeoManager_Check.pdf

Next steps

- Tentative schedule (~2 weeks):
 - Beam pipe from Amilkar
 - Needs also other parts of the Support Structure (MSC = PST+PIT, OSC)
 - Code in CVS
 - Refine the active silicon volume :
 - this can be added with no major changes to the global structure of the pixl code
 - Try to run starsim ?

- To implement the full geometry based on a single sector :
- the single sector is “inserted” in a TUBS with $\phi_1=35$ and $\phi_2=73$, which then covers the opening angle of a sector by 1 degree left and right
 - $R_{min}=2$ and $r_{max}=10$ for the same reason of defining a volume a bit larger than the “real” sector
 - A TUBS shape should be placed according to the origin of the cone
 - The origin of this shape is 0.0001 (not 0) in order to project the 2 components in X and Y
