

Pixel geometry with AGML (in CVS)

- The pixel geometry (10 sectors) is now in CVS under the tag 'dev13' geometry (library is 'eval')
- The sector is the version I've shown last week meeting:
 - Material is only 'silicon' for active ladder
 - Material is 'carbon' for the sector structure
- The new beam pipe is also included in CVS
- Thanks to Jason for the help about overlaps and hidden volumes in the geometry.

- The pixel is inside the IDSM.
- We also see here the FGT quadrants.

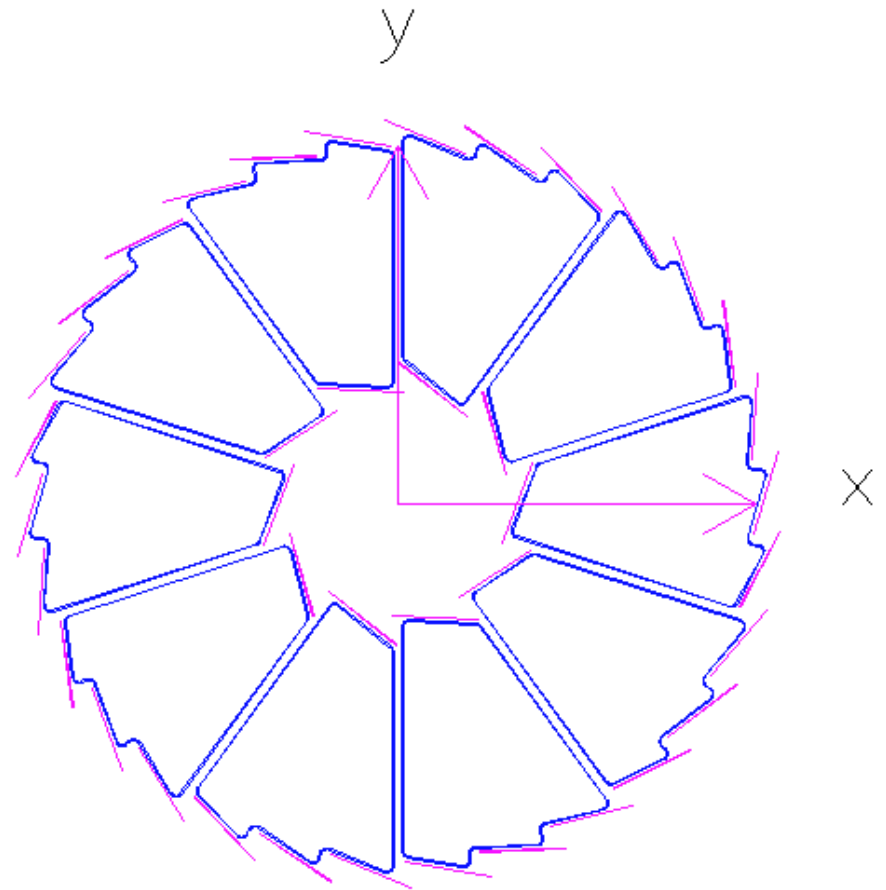

- the beam pipe in this picture is the simplified beam pipe we used with UPGR15 geometry (it has the good radius)
- the yellow axis point at radius = 1.9 cm

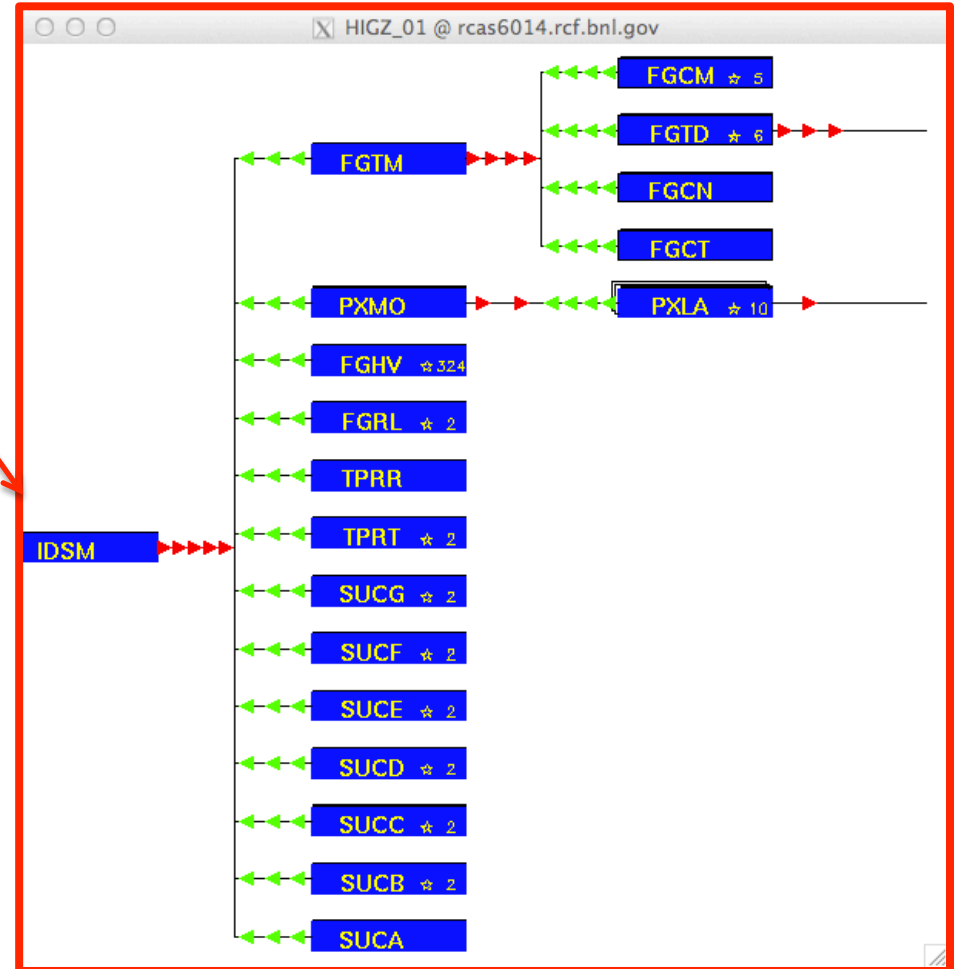

- the purple axis point at radius = 2.5 cm

- the purple axis point at radius = 8 cm

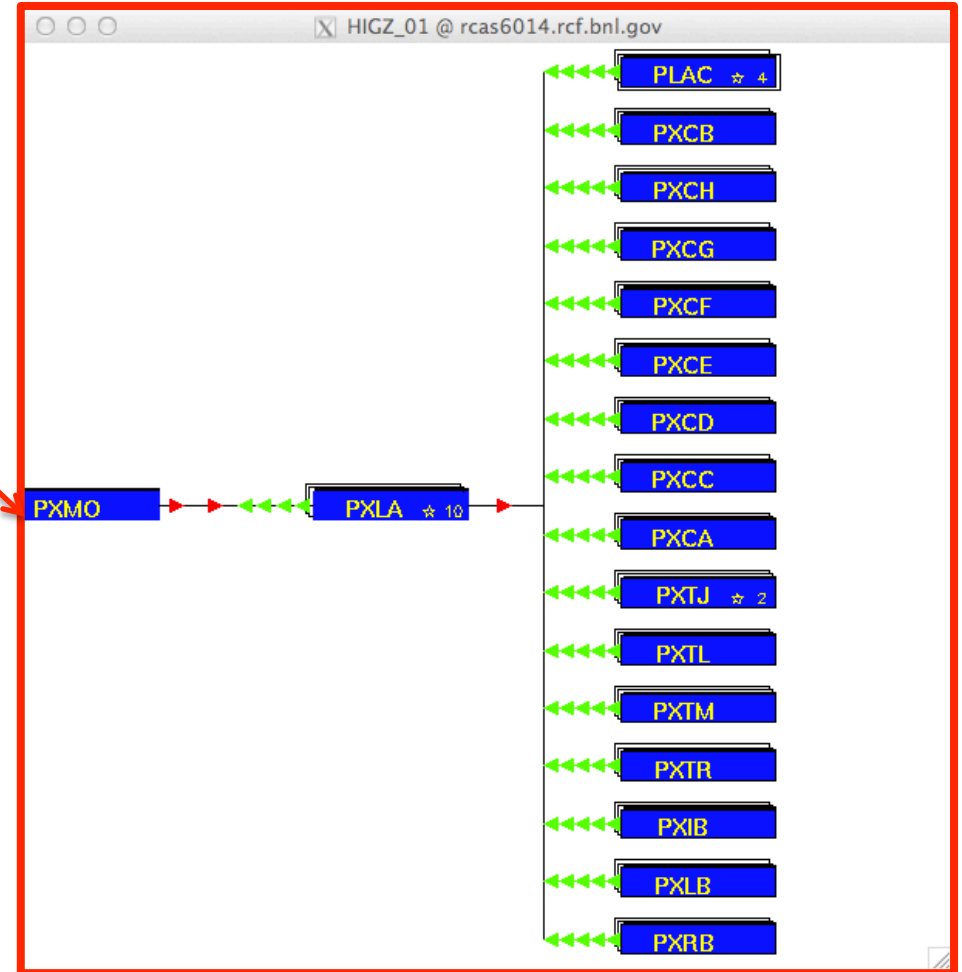

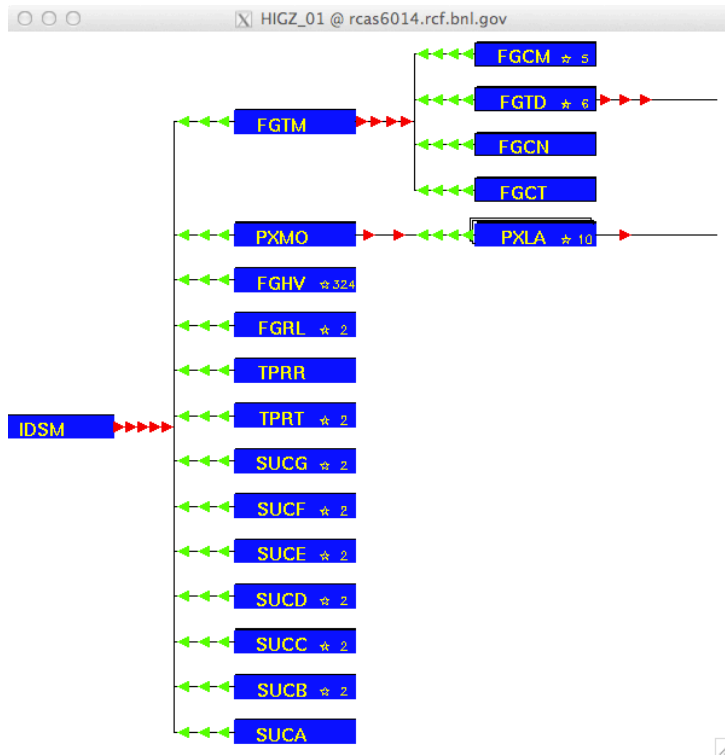

Pixel volumes/names in starsim

IDSM contains :

- the FGT (**FGTM**)
- the PIXEL (**PXMO**) made of 10 sectors (**PXLA**)

Pixel volumes/names in starsim

A sector contains :

- 4 active silicon ladders (**PLAC**)
- 16 others pieces : ladder structure

Running starsim

- 1 event with 10 pions
- ✓ Hits are found on the inner and outer layer.
- Tracks can have 3 hits because of the overlaps between ladder.

Next steps

- Try to run the BFC chain :
 - We need the proper path to the silicon ladders in the PixelFastSimMaker
 - I've checked with the Tgeo volume :
 - sector id will go from 1 to 10
 - ladder id (inside a sector) will go from 16 to 19.
 - For example, active ladders for sector 1 will have the following names
- HALL_1/CAVE_1/IDSM_1/PXMO_1/PXLA_1/PLAC_16
HALL_1/CAVE_1/IDSM_1/PXMO_1/PXLA_1/PLAC_17
HALL_1/CAVE_1/IDSM_1/PXMO_1/PXLA_1/PLAC_18
HALL_1/CAVE_1/IDSM_1/PXMO_1/PXLA_1/PLAC_19
- Update the given geometry now in CVS (pixel is still flying in the middle of the IDSM w/o any support structure) with additional material (passive silicon layer, electronics, kapton,...etc)

How to build the geo

- Following Jason's instructions (under starver eval):

```
starsim> detp geom dev13  
starsim> gexe $STAR_LIB/xgeometry.so
```

① For today only the library has to be rebuilt so one has to checkout the code and run

```
starsim> detp geom dev13  
starsim >gexe .$STAR_HOST_SYS/lib/xgeometry.so
```

Volume naming convention

- PLAC =active silicon ladder : it was the name used in UGR15

- PXCA-PXCB-PXCC-PXCD,PXCE

PXCF,PXGH,PXCH are the corners, starting from the bottom right (*):

PiXel Corner A ...

- PXTR-PXT-PXTL are the planes supporting the active silicon on the top :

PiXel Top Right ,etc...

- PXTJ are the 2 planes joining the planes on the top :

PiXel Top Join

- PXLB, PXRb, PXIB are the planes on front of the beam pipe and between 2 sectors
